Dialogue-based CALL

Dialogue-based CALL refers to any application or system allowing,

to maintain a dialogue

[immediate, synchronous interaction] [written or spoken]

with an automated agent

[tutorial CALL (≠ CMC)]

for language learning purposes.

Dialogue-based CALL Typology of systems

(Bibauw et al, under review)

Form-focused dialogue systems

Explicit constraints on meaning, focus on form/forms

e.g., ICALL intelligent language tutors, and Computerassisted pronunciation training (CAPT) systems

Goal-oriented dialogue systems

Contextual constraints (task, situated conversation...), mostly focus on meaning and interaction e.g., Conversational agents in virtual worlds

Reactive dialogue systems

Free, user-initiated, open-ended dialogue e.g., Chatbots, and personal assistants

Dialogue-based CALL Recent evolutions

Rich history of studies & systems:

- First attempts in the 80s (Underwood 1982, 1984)
- Intelligent Language Tutors developed in the 90s (Holland et al, 1995)
- Efforts with speech and dialogue in the 2000s (Raux & Eskenazi, 2004; Seneff et al, 2007; Morton et al 2012)
- Principled technological convergence more recently (Petersen, 2010; Wilske, 2015)

But nearly all systems remained internal, research-only prototypes, never made accessible to the public.

→ No comparability, no replicability

But, recently, major advances towards publicly available tools (Duolingo Bots, Alelo Enskill, ETS HALEF) and joint efforts

between industry and researchers to compare the systems and establish common ground (Sydorenko et al, 2018)

Publication variables

author, year, publication type, source, sample...

Population variables

context, age, L1, L2 proficiency level

Treatment variables

experimental design, treatment duration (weeks), time on task (hours), number of sessions, treatment density (packed vs. spaced)

System variables

system, target L2, system_type, dialogue_type, primary_modality, corrective_feedback, initiative, embodied_agent, gamified...

Instruments/outcome variables

proficiency/complexity/accuracy/fluency/vocabulary, speaking/writing, specific test

Quantitative results

n, mean, sd (pre/post, experimental/control)

Meta-analysis Computable effect sizes

Effect size: standardized measure of the observed (here, learning) effect

Effect size (*d***)** typically computed over:

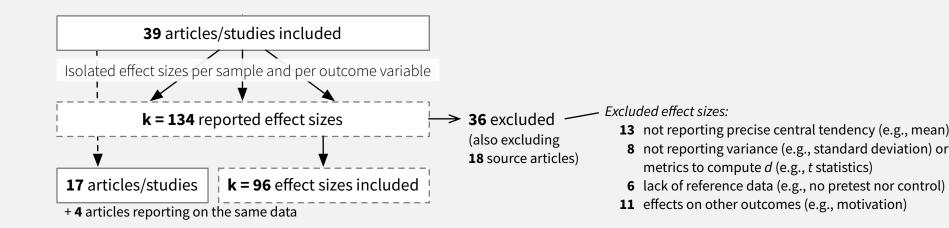

- mean
- standard deviation
- **n** (subjects)

for each group/measurement point (or alternate: t-score, etc.)

Not available for all studies (especially older studies)

Asked the authors for raw data (worked for some - thanks to them!)

Meta-analysis Inclusion of individual effect sizes

k = 96 effect sizes

Meta-analysis Effect size calculation

Effect size: standardized measure of the observed (here, learning) effect Usually, in SLA/CALL:

Standardized Mean Difference

Cohen's d (M_{post} - M_{pre} / SD_{pooled}) Hedge's g

	EC		7	
Post	61 (6.2)	57 (7.4)		ŀ
	Exp. Grp M (sd)	Control <i>M</i> (sd)	_	

_		M(sd)				
	Pre	56 (4.3)				
7.	Post	61 (6.2)				
PP						

	Exp. Grp M (sd)	Control <i>M</i> (sd)
Pre	56 (4.3)	54 (5.6)
Post	61 (6.2)	57 (7.4)

ECPP

Standardized Mean Change

Meta-analysis A comparable effect size metrics

Morris & DeShon (2002) offer a solution: comparable metrics across experimental designs (EC / PP / ECPP)

- change metric (aligned on within-group effect)
- raw metric (aligned on between-groups effect)

We selected the raw metric formula:

$$d_{\rm PP} = J(df_{\rm PP}) \left(\frac{M_{\rm post,E} - M_{\rm pre,E}}{SD_{\rm pre,E}} \right)$$

$$d_{\mathrm{ECPP}} = J(df_{\mathrm{ECPP}}) \left(\frac{M_{\mathrm{post,E}} - M_{\mathrm{pre,E}}}{SD_{\mathrm{pre,E}}} - \frac{M_{\mathrm{post,C}} - M_{\mathrm{pre,C}}}{SD_{\mathrm{pre,C}}} \right)$$

Meta-analysis Summary effect size

Model computes a **summary effect** by aggregating all the single study effect sizes

Weighting according to sample size and precision

→ More powerful, more stable, more precise and generalizable than the individual study effect sizes

Meta-analysis Multilevel modeling

Publications report multiple outcome measures (e.g., vocabulary and morphology tests) or multiple sampling groups (e.g., proficiency levels)

Traditional meta-analysis techniques allow only one (independent) effect size per study, but loosing thus all the information on distinct implementations

⇒ Including all the variation without "fooling" the model with non-independent measures:

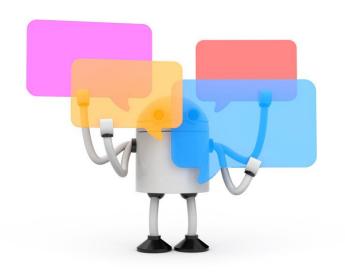

Multilevel modelling

Aggregates **multiple effects per study**, by adding an intermediate level of *within-*study variation.

Table 1: Levels of multilevel meta-analytic model

	Level	Number of clusters/items	Source of variance
1	Samples	$k = 96 \ (n = 803)$	Random sampling variance
2	Effects sizes	k = 96	Variation within study
3	Studies	l = 17	Variation between studies

Results Summary effect

General effectiveness of dialogue-based CALL for L2 proficiency development (k = 96):

$$d = 0.605$$
 *** 95% CI = [0.377, 0.833]

= Medium effect (Plonsky & Oswald, 2014)

Results & discussion Summary effect compared to CALL/SLA

Global effect close to the median of meta-analyses in CALL/SLA (Plonsky & Oswald, 2014)

- \geq game-based learning (d = .53, Chiu et al, 2012)
- \leq CALL in general (d = .84, Plonsky & Ziegler, 2016)

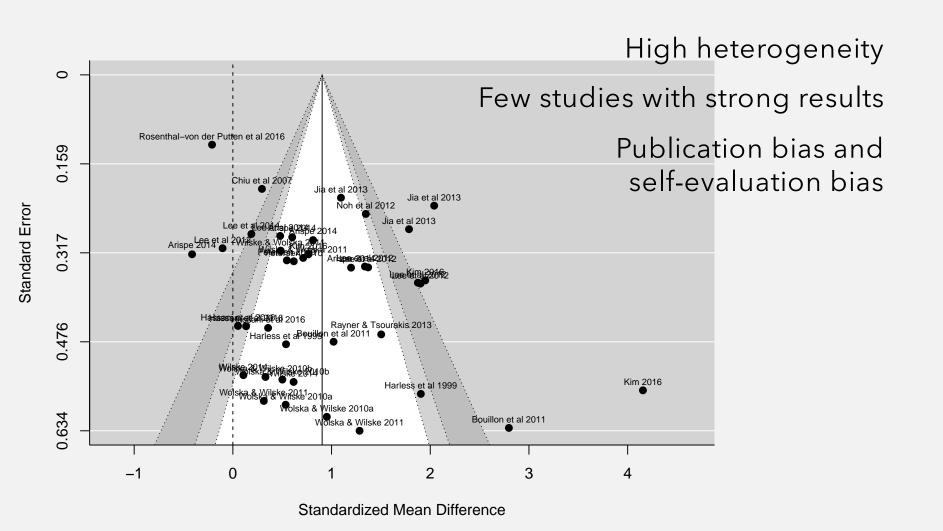

Consistent with effect of face-to-face interaction (Mackey & Goo, 2007) and SCMC.

- \lesssim F2F interaction (d = .75, Mackey & Goo, 2007)
- ≤ SCMC (Ziegler, 2015; Lin, 2015)

Slightly inferior, but logical:

- Human interlocutors remain the gold standard!
- Outcome variables often very ambitious (holistic proficiency...) and treatment duration often very reduced (≤ 3h)

Results & discussion Limitations

Moderator analysis Evolution across time

Moderator analysis Experimental design

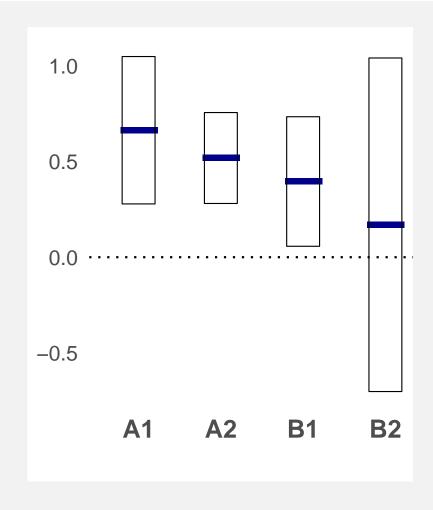

Moderator analysis

Participants: L2 proficiency

Beginners benefit more from these systems than advanced learners

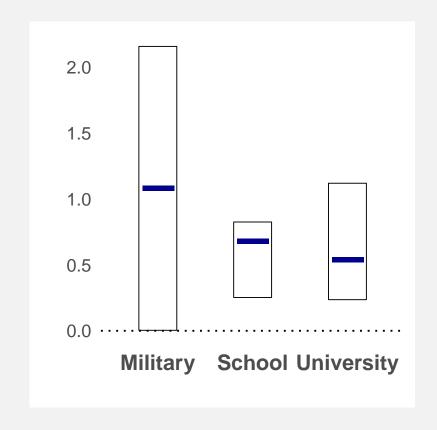

Very significant difference and predictor (Q(df=3) = 10.8, p < .001)

Moderator analysis Context

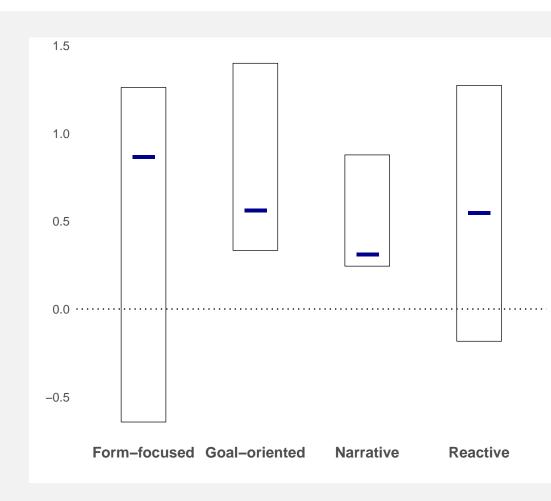

No significant difference (p = .58)

Seems to be effective both in the school as the university context (+ external, such as military, underrepresented).

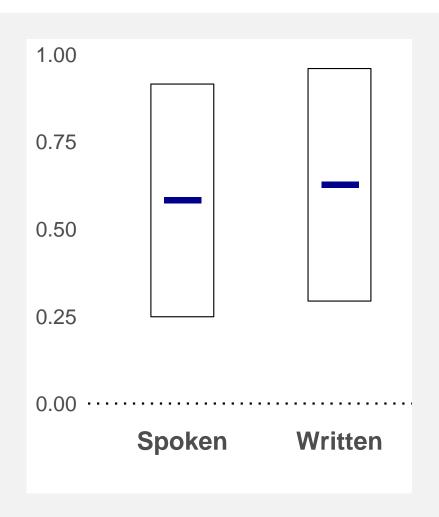

Moderator analysis Type of system

Goal-oriented systems seem to be more effective globally.

Moderator analysis System modality

Very similar effects, in both modalities.

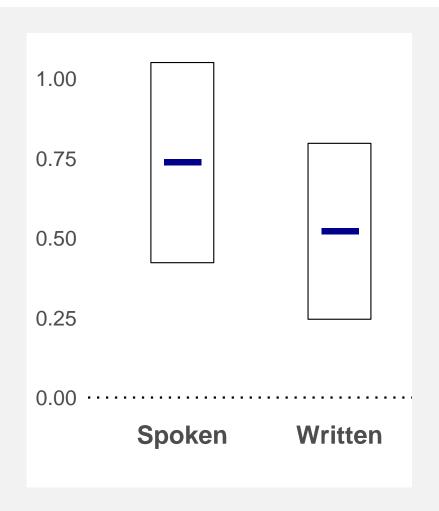

Moderator analysis System: Corrective feedback

Consistently with what we know about corrective feedback, systems providing feedback are much more effective

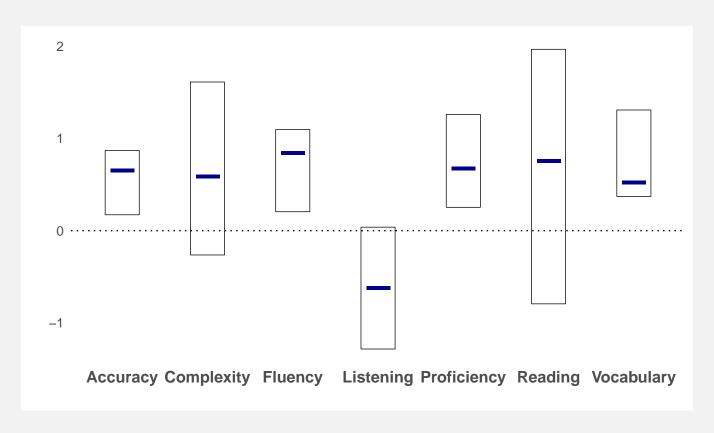

Moderator analysis Outcome modality

Higher effect on speaking

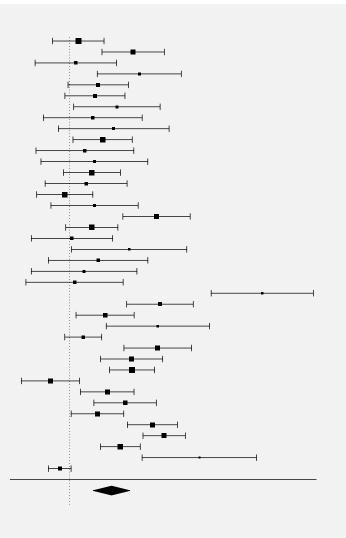

Moderator analysis Outcome variables

More promising effects on **fluency**

Dialogue-based CALL: meta-analysis Summary

Medium effect of dialogue-based CALL on L2 proficiency development d = .605 ***

Possibly differentiated effect depending on proficiency level, system modality & test modality
But these observations still need to be confirmed by other studies

Need for more **comparable** designs, big enough samples and precise instruments Future research should inscribe itself in this

emerging field and compare its results within the field

Thank you! Merci! Dank u! ¡Gracias!
